1 Marketing Insights for E-Commerce Company

1.1 Problem Statement:

A rapidly growing e-commerce company aims to transition from intuition-based marketing to a data-driven approach. By analyzing customer demographics, transaction data, marketing spend, and discount details from 2019, the company seeks to gain a comprehensive understanding of customer behavior. The objectives are to optimize marketing campaigns across various channels, leverage data insights to enhance customer retention, predict customer lifetime value, and ultimately drive sustainable revenue growth.

1.2 Expectations:

Through this project, we expect to leverage a range of data analysis techniques to uncover actionable insights that propel the e-commerce company towards significant customer retention and revenue growth.

Key Metrics and Objectives:

1. **Identifying Key Customer Segments and Behaviors:**
   - Utilize descriptive statistics and segmentation techniques to understand what drives customer acquisition and churn.
2. **Evaluating Marketing Campaign Effectiveness:**
   - Employ hypothesis testing to assess the impact of online and offline marketing efforts on customer behavior and revenue.
3. **Optimizing Discount Strategies:**
   - Analyze the influence of discounts and promotions on revenue and customer engagement to identify optimal pricing strategies.
4. **Predicting Customer Lifetime Value:**
   - Implement data-driven models to anticipate future customer value and prioritize retention efforts.
5. **Unveiling Cross-Selling Opportunities:**
   - Perform market basket analysis to discover frequently co-purchased products and inform product placement strategies.
6. **Formulating Data-Driven Recommendations:**
   - Present clear and compelling visualizations and reports that translate insights into actionable marketing strategies for maximizing customer retention and revenue growth.

1.3 Dataset Description

Transaction data has been provided from 1st Jan 2019 to 31st Dec 2019.

1.3.1 Datasets:

1. **Online_Sales.csv**
    - **CustomerID**: Customer unique ID
    - **Transaction_ID**: Transaction Unique ID
    - **Transaction_Date**: Date of Transaction
    - **Product_SKU**: SKU ID – Unique Id for product
    - **Product_Description**: Product Description
    - **Product_Category**: Product Category
    - **Quantity**: Number of items ordered
    - **Avg_Price**: Price per one quantity
    - **Delivery_Charges**: Charges for delivery
    - **Coupon_Status**: Any discount coupon applied
2. **Customers_Data.csv**
    - **CustomerID**: Customer Unique ID
    - **Gender**: Gender of customer
    - **Location**: Location of Customer
    - **Tenure_Months**: Tenure in Months
3. **Discount_Coupon.csv**
    - **Month**: Discount coupon applied in that month
    - **Product_Category**: Product category
    - **Coupon_Code**: Coupon Code for given Category and given month
    - **Discount_pct**: Discount Percentage for given coupon
4. **Marketing_Spend.csv**
    - **Date**: Date
    - **Offline_Spend**: Marketing spend on offline channels like TV, Radio, Newspapers, hoardings etc.
    - **Online_Spend**: Marketing spend on online channels like Google keywords, Facebook etc.
5. **Tax_Amount.csv**
    - **Product_Category**: Product Category
    - **GST**: Percentage of GST

import seaborn as sns
from scipy.stats import ttest_ind,spearmanr,chi2_contingency,levene,shapiro
#!pip install --upgrade seaborn
#!pip install pingouin
import pingouin as pg
#!pip install mlxtend
from mlxtend.frequent_patterns import apriori, association_rules
from operator import attrgetter
```

```python
import pickle
from sklearn.model_selection import train_test_split, GridSearchCV
from category_encoders import TargetEncoder
from sklearn.metrics import mean_squared_error as MSE
from sklearn.linear_model import LinearRegression,Lasso,Ridge
from sklearn.ensemble import StackingRegressor

import warnings
warnings.simplefilter('ignore')
```

[2]:
```python
dfs=pd.read_csv('data/Online_Sales.csv')
dfc=pd.read_csv('data/Customers.csv')
dfd=pd.read_csv('data/Discount_Coupon.csv')
dfm=pd.read_csv('data/Marketing_Spend.csv')
dft=pd.read_csv('data/Tax_amount.csv')
```

[3]:
```python
names=['sales','customers','discounts','marketing','taxes']
df_s=[dfs,dfc,dfd,dfm,dft]
for i in range(5):
    print(f'Shape of {names[i]} dataframe : ')
    print(df_s[i].shape)
    print()
    print(f'Number of missing values in {names[i]} dataframe : ')
    print(df_s[i].isna().sum().sum())
    print()
```

```
Shape of sales dataframe :
(52924, 10)

Number of missing values in sales dataframe :
0

Shape of customers dataframe :
(1468, 4)

Number of missing values in customers dataframe :
0

Shape of discounts dataframe :
(204, 4)

Number of missing values in discounts dataframe :
0

Shape of marketing dataframe :
(365, 3)
```

```
Number of missing values in marketing dataframe :
0

Shape of taxes dataframe :
(20, 2)

Number of missing values in taxes dataframe :
0
```

1.4 All datasets have no null values and the following shapes: sales (shape: 52924, 10), customers (shape: 1468, 4), discounts (shape: 204, 4), marketing (shape: 365, 3), and taxes (shape: 20, 2).

1.5 Preprocessing and Cleaning

1.5.1 Merging with taxes dataframe on `Product_Category`.

[4]:
```
df=dfs.merge(dft,on='Product_Category',how='left')
df.CustomerID=df.CustomerID.astype('object')
df.Transaction_ID=df.Transaction_ID.astype('object')
df.dtypes
```

[4]:
```
CustomerID              object
Transaction_ID          object
Transaction_Date        object
Product_SKU             object
Product_Description     object
Product_Category        object
Quantity                 int64
Avg_Price              float64
Delivery_Charges       float64
Coupon_Status           object
GST                     object
dtype: object
```

1.5.2 Converting Transaction_Date to datetime and extracting month.

[5]:
```
df['Transaction_Date'] = pd.to_datetime(df['Transaction_Date'])
df['Month'] = df['Transaction_Date'].dt.strftime('%b')
```

1.5.3 Merging with discounts dataframe on `Month` and `Product_Category`.

1.5.4 Applying coupon if `Coupon_Status` is 'Used'.

[6]:
```
df=df.merge(dfd,on=['Month','Product_Category'],how='left')
df['Coupon']=df['Coupon_Status'].apply(lambda x:1 if x=='Used' else 0)
df=df.rename(columns={'Coupon_Code_x':'Coupon_Code','Discount_pct_x':
↪'Discount_pct'}).drop(columns=['Coupon_Status'])
```

1.5.5 Converting GST to integer and calculating total Invoice Value.

[7]:
```
df['GST']=df['GST'].str.replace('%', '').astype(int)
df['Invoice']=(df['Quantity']*df['Avg_Price'])*(df['Coupon']*(1-df['Discount_pct']/
↪100))*(1+df['GST']/100)+df['Delivery_Charges']
df.head()
```

[7]:

1.5.12 Top 5 Product SKUs by Total Invoice:

1. **GGOENEBJ079499**: This SKU corresponds to the Nest Learning Thermostat 3rd Gen-USA - Stainless Steel, which aligns with its top position in terms of total invoice amount.
2. **GGOENEBQ078999**: This SKU represents the Nest Cam Outdoor Security Camera - USA, confirming its popularity as the second-highest in total invoice amount.
3. **GGOENEBB078899**: This SKU corresponds to the Nest Cam Indoor Security Camera - USA, reflecting its strong sales performance as the third-highest in total invoice amount.
4. **GGOENEBQ079099**: Despite being ranked fourth, this SKU corresponds to the Nest Protect Smoke + CO White Battery Alarm-USA, indicating significant sales volume for this product variant.
5. **GGOENEBQ079199**: Similar to the previous SKU, this one corresponds to the wired variant of the Nest Protect Smoke + CO White Alarm-USA, indicating consistent demand for both battery and wired options. tegory.

1.5.13 Top 5 Product Descriptions by Total Invoice:

1. **Nest Learning Thermostat 3rd Gen-USA - Stainless Steel**: This product description tops the list in terms of total invoice amount, indicating high demand for this particular Nest product variant.
2. **Nest Cam Outdoor Security Camera - USA**: The outdoor security camera from Nest is the second highest in terms of total invoice amount, suggesting a strong interest in home security products.
3. **Nest Cam Indoor Security Camera - USA**: Following closely behind the outdoor camera, the indoor security camera variant also enjoys significant sales, reflecting a growing concern for home safety.
4. **Nest Protect Smoke + CO White Battery Alarm-USA**: This product description indicates a demand for smoke and CO detectors with battery functionality, as it ranks fourth in total invoice amount.
5. **Nest Protect Smoke + CO White Wired Alarm-USA**: Similar to the battery-powered variant, the wired smoke and CO detector also sees considerable sales, rounding up the top 5 product d

1.5.14 Top 5 Product Categories by Total Invoice:

1. **Nest-USA**: Despite having only one item per invoice, Nest-USA has the highest total invoice amount, indicating high-value purchases.
2. **Apparel**: Apparel follows closely behind Nest-USA in terms of total invoice amount, suggesting a strong demand for clothing products.
3. **Office**: Although ranking third, the Office category has a considerable total invoice amount, indicating a significant volume of purchases, likely for office supplies.

4. **Nest**: Similar to Nest-USA, the Nest category also has a high total invoice amount, indicating a strong demand for Nest products overall.
5. **Drinkware**: Despite ranking fifth, Drinkware has a noteworthy total invoice amount, indicating consistent sales in this product category.ry and wired options.

These insights provide a deeper understanding of the top-performing product categories, descriptions, and SKUs based on their total invoice amounts. total invoice amounts.

1.5.15 Top 5 Months in terms of revenue

1.5.17 Top 5 Months by Total Invoice:

1. **January (Jan)**: January ranks first in terms of total invoice amount, indicating strong sales at the beginning of the year, possibly due to New Year promotions or post-holiday shopping.
2. **November (Nov)**: November closely follows January in total invoice amount, likely boosted by holiday shopping, Black Friday, and Cyber Monday sales.
3. **August (Aug)**: August ranks third in total invoice amount, suggesting strong summer sales, possibly due to back-to-school promotions or end-of-summer clearance events.
4. **October (Oct)**: October comes in fourth place in terms of total invoice amount, possibly benefiting from fall promotions or early holiday shopping.

5. **April (Apr)**: April rounds up the top five months by total invoice amount, indicating solid spring sales, possibly driven by seasonal products or Easter promotions.

1.5.18 Top 5 Coupon Codes by Total Invoice:

1. **ELEC10**: This coupon code has the highest total invoice amount, suggesting that customers are taking advantage of a 10% discount on electronic products, driving significant sales volume.
2. **ELEC20**: The ELEC20 coupon code ranks second in terms of total invoice amount, indicating a strong response to a 20% discount on electronic items.
3. **ELEC30**: Despite being lower than ELEC10 and ELEC20, the ELEC30 coupon code still enjoys considerable usage, indicating a demand for products eligible for a 30% discount on electronics.
4. **SALE10**: This coupon code offers a 10% discount and ranks fourth in total invoice amount, indicating moderate usage compared to the electronics-focused codes.
5. **SALE30**: SALE30 ranks fifth in terms of total invoice amount, suggesting that customers are attracted to a 30% discount on a wide range of products, driving notable sales volume.

These insights provide a glimpse into the top-performing months and coupon codes based on their total invoice amounts, indicating peak sales periods and popular discount offerings.

[22]:
```
print('Range of Dates')
dfm['Date']=pd.to_datetime(dfm['Date'])
print((df['Transaction_Date'].min(), df['Transaction_Date'].max(),␣
 ↪(df['Transaction_Date'].max() - df['Transaction_Date'].min()).days))
print((dfm['Date'].min(), dfm['Date'].max(), (dfm['Date'].max() - dfm['Date'].
 ↪min()).days))
```

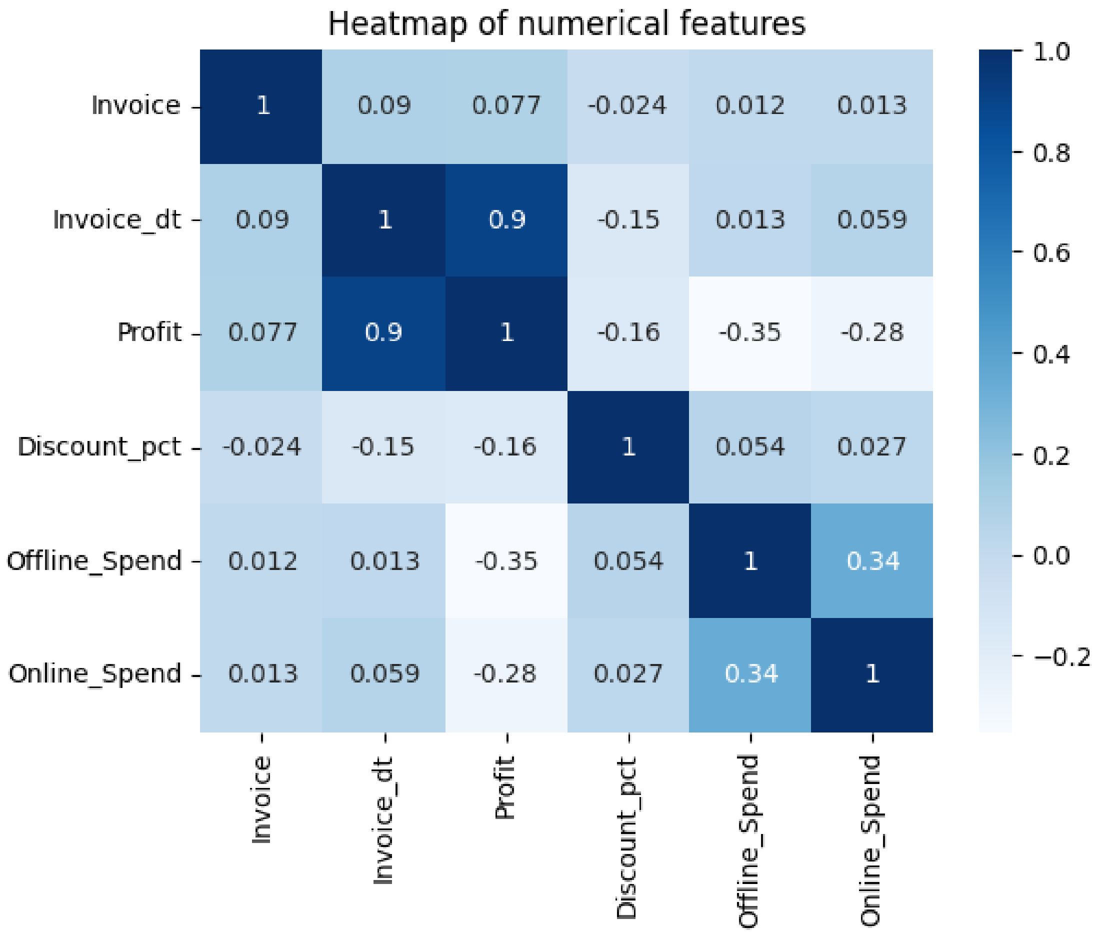
```
Range of Dates
(Timestamp('2019-01-01 00:00:00'), Timestamp('2019-12-31 00:00:00'), 364)
(Timestamp('2019-01-01 00:00:00'), Timestamp('2019-12-31 00:00:00'), 364)
```

1.5.19 The data has records from 1st Jan 2019 to 31st December 2019 over a span of 365 days.

1.5.20 Merging with marketing dataframe on `Transaction_Date`.

[23]:
```
df=df.merge(dfm,left_on='Transaction_Date',right_on='Date')
df['Invoice_dt']=df.groupby('Date')['Invoice'].transform('sum')
df['Profit']=df['Invoice_dt']-df['Offline_Spend']-df['Online_Spend']
df=df.drop(columns='Date').rename(columns={'Transaction_Date':'Date'})
```

[24]:
```
columns=['Invoice','Invoice_dt','Profit','Discount_pct','Offline_Spend','Online_Spend']
plt.title('Heatmap of numerical features')
sns.heatmap(df[columns].corr(),annot=True,cmap='Blues')
plt.show()
```

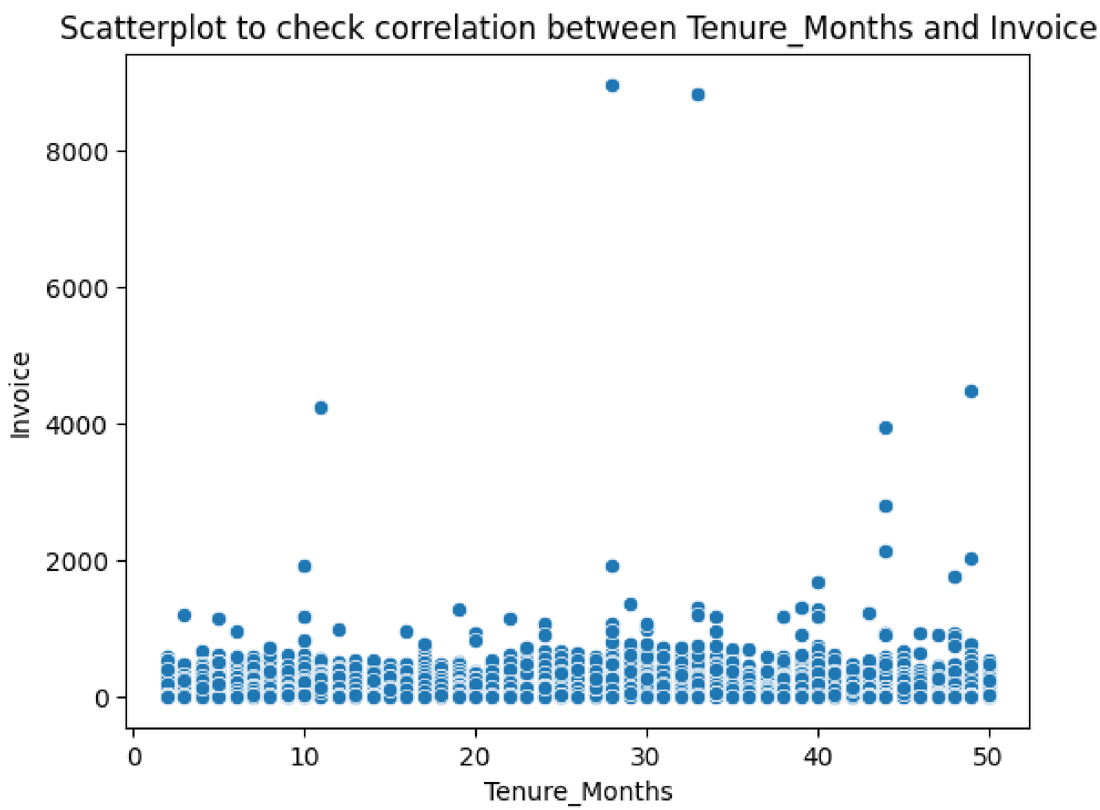


1.6 `Profit` and total `Invoice` per date is strongly correlated(.9) which is expected and `Offline_Spend` and `Online_Spend` is mildly correlated(.34).

1.6.1 Merging with customers dataframe on `CustomerID`.

[25]:
```
df=df.merge(dfc,on='CustomerID')
```

[26]:
```
sns.scatterplot(data=df,x='Tenure_Months',y='Invoice')
plt.title('Scatterplot to check correlation between Tenure_Months and Invoice')
plt.show()
print('Spearman rank correlation')
print(spearmanr(df['Tenure_Months'],df['Invoice']))
```



```
Spearman rank correlation
SignificanceResult(statistic=-0.006958459528620117, pvalue=0.10942337964383664)
```

1.6.2 Mostly `Invoice` is equally distributed withh respect to different `Tenure_Months` with 2 huge outliers above 8000.

[27]:
```
df[df['Invoice']>8000]
```

[27]:
```

```

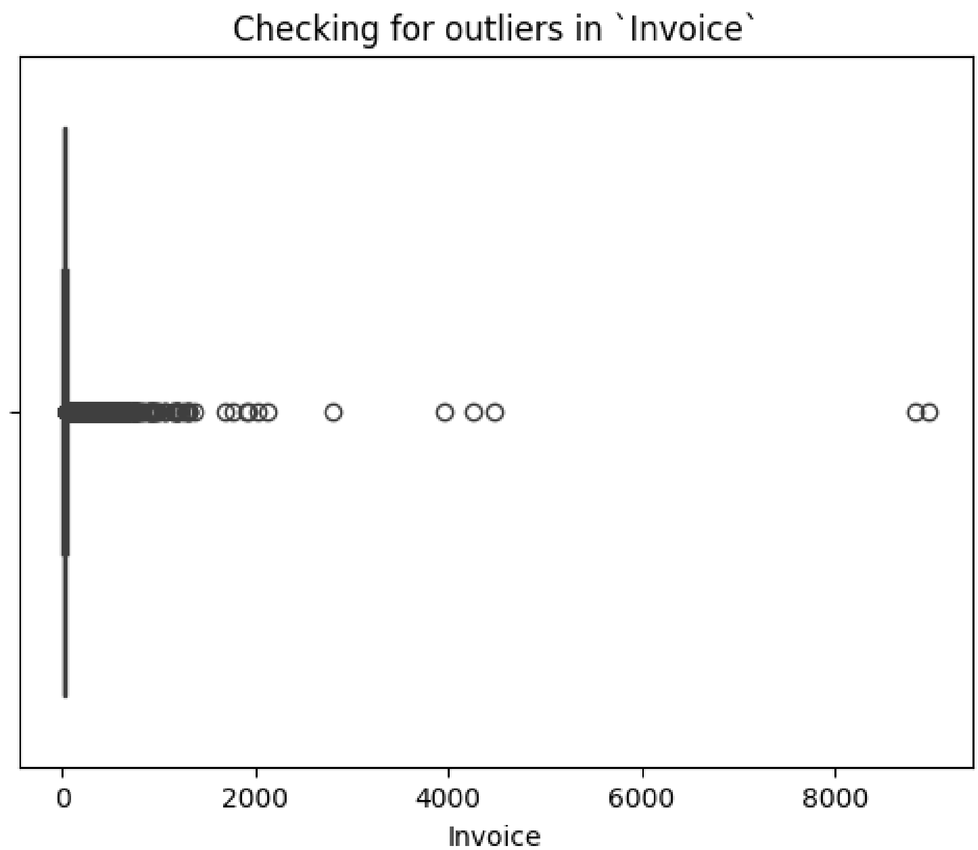
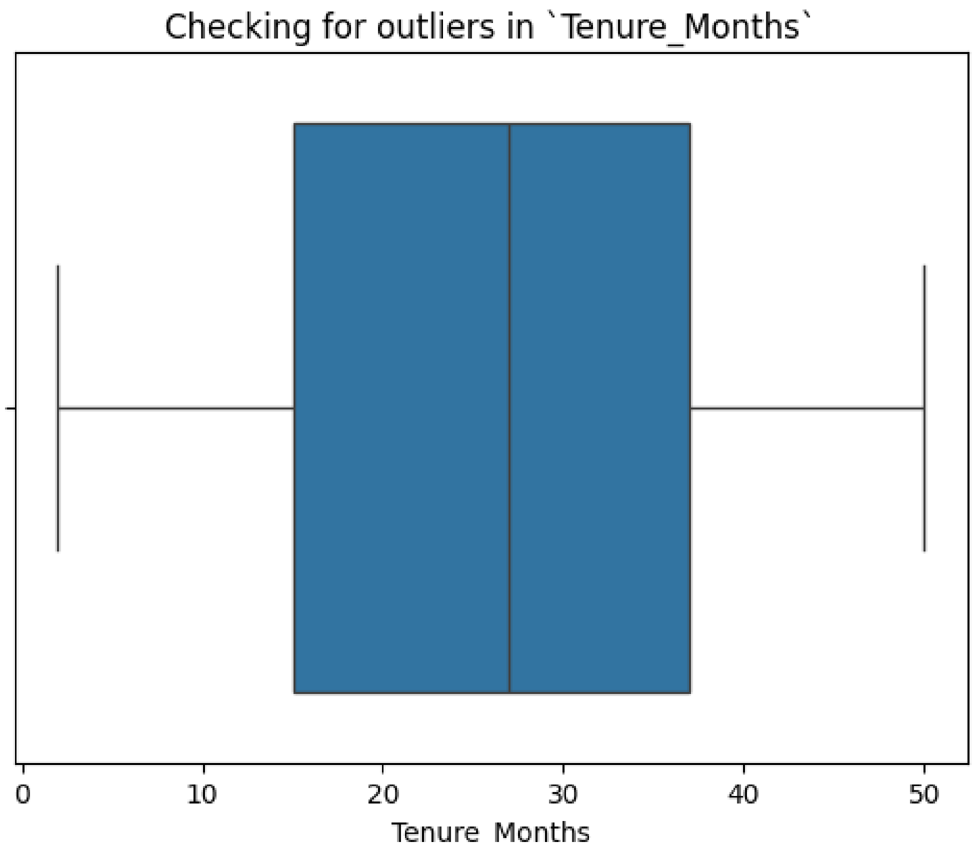
1.6.3 Outliers in `Invoice` column

[28]:
```python
sns.boxplot(data=df,x='Invoice')
plt.title('Checking for outliers in `Invoice`')
plt.show()
```



1.6.4 No outliers in `Tenure_Months` column

[29]:
```python
sns.boxplot(data=df,x='Tenure_Months')
plt.title('Checking for outliers in `Tenure_Months`')
plt.show()
```



1.7 Though there are outliers due to bulk ordering since we are not using any assumptions based ML models, outliers are left as it is and Ttest will be used which is more robust.

1.8 Tenure_Months have no outliers with normal distribution with mean around 28 months.

1.8.1 Binning Tenure.

[30]:
```
bin_edges = [0, 10, 20, 30, 40, float('inf')]
bin_labels = ['0-10', '10-20', '20-30', '30-40', '>40']
df['Tenurebin'] = pd.cut(df['Tenure_Months'], bins=bin_edges, labels=bin_labels)
```

[31]:
```
df_profit=df.loc[:
↪,['Date','Offline_Spend','Online_Spend','Profit','Invoice_dt']].

3             12  Chicago      M
4             12  Chicago      M
```

2 Cohort Analysis

[32]:
```
df['CohortMonth'] = df.groupby('CustomerID')['Date'].transform('min').dt.
 ↪to_period('M')

df['TransactionMonth'] = df['Date'].dt.to_period('M')

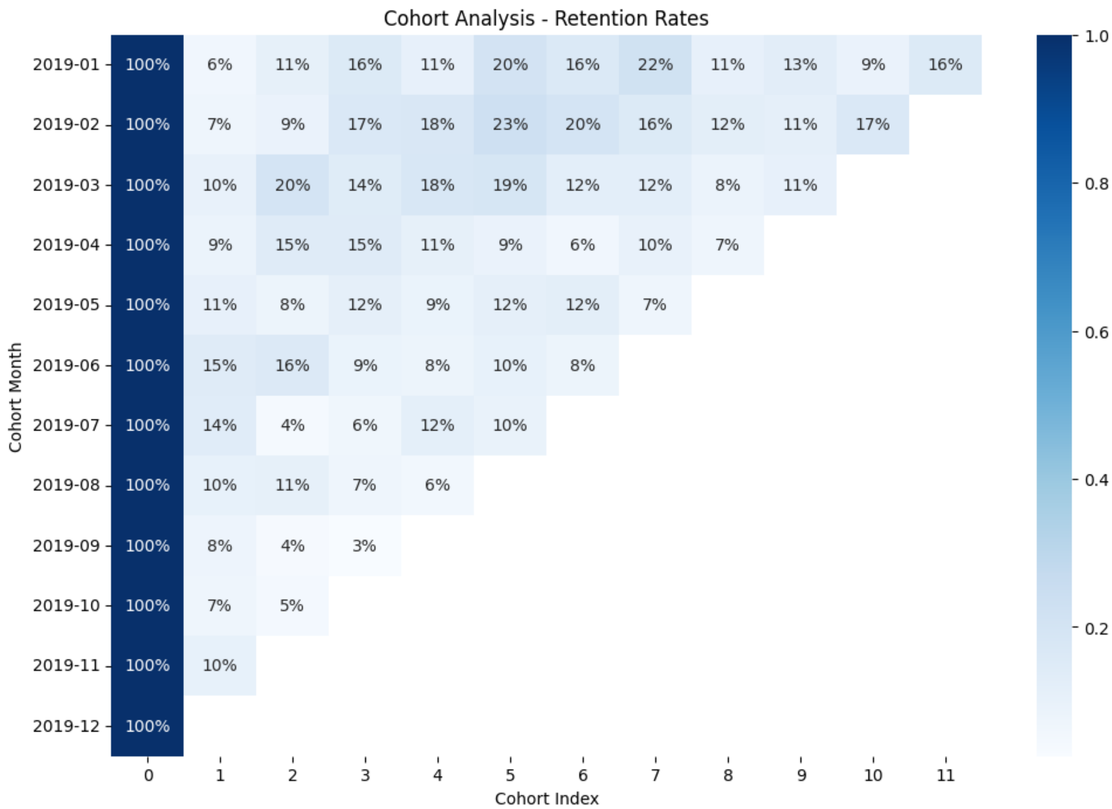
df['CohortIndex'] = (df['TransactionMonth'] - df['CohortMonth']).
 ↪apply(attrgetter('n'))

cohort_data = df.groupby(['CohortMonth', 'CohortIndex'])['CustomerID'].
 ↪nunique().reset_index()

cohort_counts = cohort_data.pivot(index='CohortMonth', columns='CohortIndex',␣
 ↪values='CustomerID')

cohort_sizes = cohort_counts.iloc[:,0]
retention = cohort_counts.divide(cohort_sizes, axis=0)
```

```
plt.figure(figsize=(12, 8))
sns.heatmap(retention, annot=True, fmt='.0%', cmap='Blues')
plt.title('Cohort Analysis - Retention Rates')
plt.ylabel('Cohort Month')
plt.xlabel('Cohort Index')
plt.show()
```



2.1 Cohorts '2019-01' and '2019-02' are slightly outperforming in terms of retention with other cohorts.

3 Temporal Trends due to Marketing

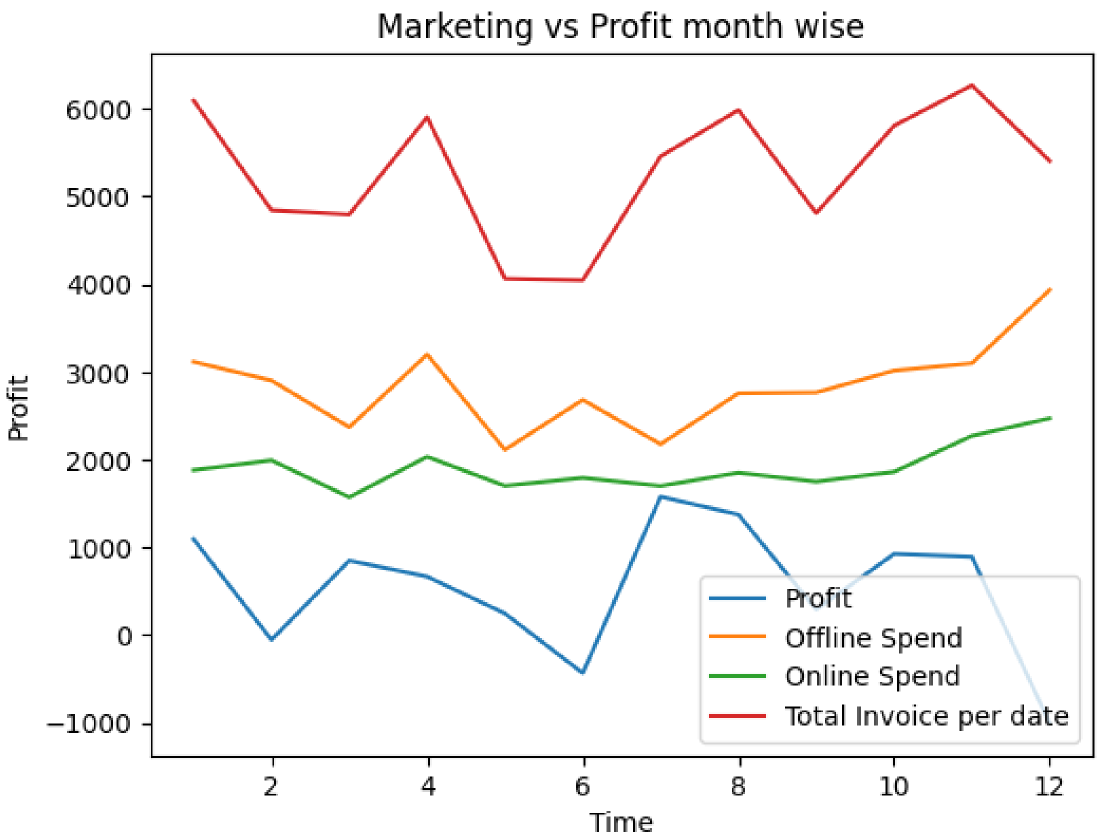
[33]:
```
df_profit['Time'] = df_profit.Date.dt.month

sns.lineplot(data=df_profit, x='Time', y='Profit', ci=None, label='Profit')
sns.lineplot(data=df_profit, x='Time', y='Offline_Spend', ci=None,␣
 ↪label='Offline Spend')
sns.lineplot(data=df_profit, x='Time', y='Online_Spend', ci=None, label='Online␣
 ↪Spend')
```

```
sns.lineplot(data=df_profit, x='Time', y='Invoice_dt', ci=None, label='Total␣
↪Invoice per date')

plt.title('Marketing vs Profit month wise')
plt.legend()

plt.show()
```



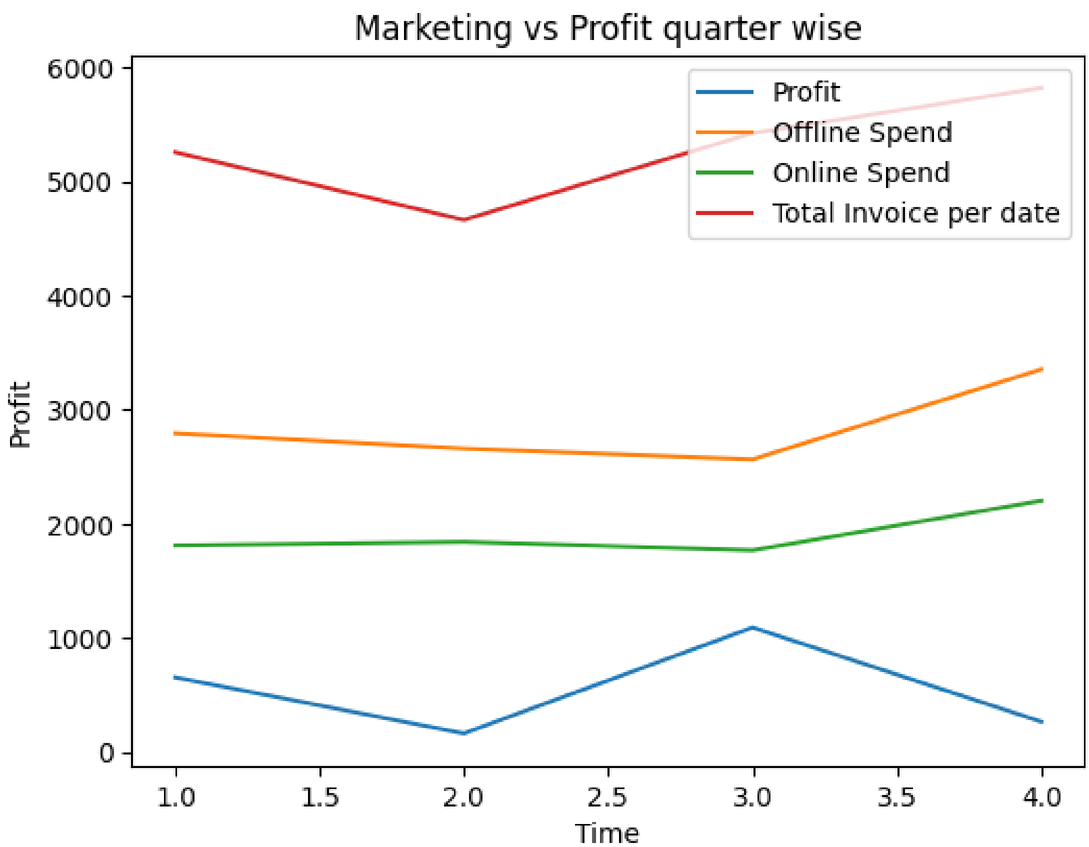
[34]:
```
df_profit['Time'] = df_profit.Date.dt.quarter

sns.lineplot(data=df_profit, x='Time', y='Profit', ci=None, label='Profit')
sns.lineplot(data=df_profit, x='Time', y='Offline_Spend', ci=None,␣
↪label='Offline Spend')
sns.lineplot(data=df_profit, x='Time', y='Online_Spend', ci=None, label='Online␣
↪Spend')
sns.lineplot(data=df_profit, x='Time', y='Invoice_dt', ci=None, label='Total␣
↪Invoice per date')

plt.title('Marketing vs Profit quarter wise')
```

```
plt.legend()

plt.show()
```



[35]:
```
df_profit['Time'] = df_profit['Date'].dt.isocalendar().week

sns.lineplot(data=df_profit, x='Time', y='Profit', ci=None, label='Profit')
sns.lineplot(data=df_profit, x='Time', y='Offline_Spend', ci=None,␣
 ↪label='Offline Spend')
sns.lineplot(data=df_profit, x='Time', y='Online_Spend', ci=None, label='Online␣
 ↪Spend')
sns.lineplot(data=df_profit, x='Time', y='Invoice_dt', ci=None, label='Total␣
 ↪Invoice per date')

plt.title('Marketing vs Profit week wise')
plt.legend()

plt.show()
```

3.1 Middle of the year shows lowest spendings and maximum profit typically in Q02-Q03 and week number 32 in month 7-8.Lowest profit is seen during end of the year when marketing efforts require more spendings and also volume of sales is going down.

4 RFM Analysis

[36]:
```
df=df.drop_duplicates(subset=['CustomerID','Transaction_ID','Product_SKU'])

5.0.1 Single Product Association:

1. **Association between Specific Products:**
    - There is a significant association between the Nest Cam Indoor Security Camera - USA and the Nest Cam Outdoor Security Camera - USA. This association is bidirectional, indicating that customers who purchase one camera are likely to purchase the other as well.
    - Similarly, there is a strong association between product SKUs GGOEGHGC019799 and GGOEGHGR019499, suggesting that customers who buy one SKU are highly likely to purchase the other.

5.0.2 Product Combination and Cross-Category Associations:

2. **Association between Product Combinations and Cross-Category Behavior:**
    - This analysis identifies associations not only between specific product combinations but also across different categories. For instance, it observes a notable association between lifestyle products and the purchase of office and bags items together, indicating that customers interested in lifestyle products tend to also buy office and bags items. Additionally, it uncovers associations between drinkware and office items purchased together, suggesting that customers purchasing drinkware are likely to buy office supplies. Moreover, it recognizes that office items have associations with various other categories such as bags, lifestyle, and drinkware, indicating common purchasing patterns across different product categories. These findings provide insights into customer preferences and behaviors, facilitating opportunities for cross-selling and marketing strategies across a diverse range of product categories.

6.1 Descriptive Statistics Insight:

- **Customer Count**: There are 1468 unique customers in the dataset.
- **Transaction Count**: There are 25061 unique transactions in the dataset.
- **Date**: Transactions span from January 1, 2019, to December 31, 2019, with an average transaction date of July 5, 2019.
- **Invoice Amount**: The average invoice amount is $36.51, with a minimum of $0 and a maximum of $8,979.28.
  - Std: $99.08
  - Median: $6.50
- **Quantity**: The average quantity per transaction is 4.50, with a minimum of 1 and a maximum

of 900.
    - Std: 20.10
    - Median: 1.00
- **Product Category**: The most frequent product category is Apparel, accounting for 18,126 transactions.
- **Month**: Transactions are spread across 12 months, with August being the most frequent month (6,150 transactions).
- **Coupon Code**: The most frequently used coupon code is SALE20, used in 6,373 transactions.
- **Discount Percentage**: Coupon is applied 33.83% times with mean percentage 19.8% and minimum of 0% and maximum of 30%.
    - Std: 8.29%
    - Median 20%
- **Tenure Months**: The average tenure of customers is approximately 26.13 months, with a range from 2 to 50 months.
    - Std: 13.48 months
    - Median: 27.00 months
- **Location**: The majority of transactions (18380) originate from Chicago.
- **Gender**: Transactions are primarily from female customers, with a frequency of 33,007.
- **RFM Segment**: The most common RFM segment is Potential Loyalists, identified in 18,250 transactions.
- **Churn Rate**: The overall churn rate is approximately 6.83%.

7.1 GGOENEBJ079499 is the most popular.

7.2 For Coupon_Code there are variety of most frequent products based on the specific code.

8 Hypothesis Testing

8.0.1 Significance level (alpha) is set to .05 if not mentioned otherwise.

8.0.2 Independent ttest to check difference in mean invoice across Gender and churn

H0 : The mean Invoice among the 2 subgroups of each category is same.

H1 : The mean Invoice among the 2 subgroups of each category is significantly difference.

Significance level(alpha) is set to .05 .

[51]:
```
M,f=df[df['Gender']=='M']['Invoice'],df[df['Gender']=='F']['Invoice']
ttest_gender = ttest_ind(f,M)
if ttest_gender.pvalue <= 0.05:
    print(f"There is a statistically significant difference in mean invoice␣
 ↪between genders. pvalue : {ttest_gender.pvalue}")
else:
    print(f"There is NO statistically significant difference in mean invoice␣
 ↪between genders. pvalue : {ttest_gender.pvalue}")

Nc,c=df[df['churn']==0]['Invoice'],df[df['churn']==1]['Invoice']
ttest_churn = ttest_ind(Nc,c)
if ttest_churn.pvalue <= 0.05:
    print(f"There is a statistically significant difference in mean invoice␣
 ↪between churned and non-churned customers.  pvalue : {ttest_churn.pvalue}")
else:
    print(f"There is NO statistically significant difference in mean invoice␣
 ↪between churned and non-churned customers. pvalue : {ttest_churn.pvalue}")
```

```
There is NO statistically significant difference in mean invoice between
genders. pvalue : 0.2813480064152183
There is a statistically significant difference in mean invoice between churned
and non-churned customers.  pvalue : 4.8909588067553136e-11
```

8.0.3 ANOVA and Kruskal-Walis for Tenurebin and rfm_segment and Location and Coupon_Code.

H0 : The mean Invoice among the subgroups of each category is same.

H1 : The mean Invoice among the subgroups of each category is significantly difference.

Significance level(alpha) is set to .05 .

8.0.4 Statistical Test Results:

1. **Gender Invoice Comparison:**
   - There is NO statistically significant difference in mean invoice between genders (p-value: 0.281).
2. **Churn Invoice Comparison:**
   - There is a statistically significant difference in mean invoice between churned and non-churned customers (p-value: 4.89e-11).
3. **Assessment of Normality:**
   - Invoice data is not normally distributed.
4. **Tenurebin Kruskal-Wallis Test:**
   - Levene's test indicates homogeneity of variance (p-value: 0.61).
   - Kruskal results suggest a statistically significant difference in mean invoice across tenure bins (p-value: 3e-6).
5. **rfm_segment Kruskal-Wallis Test:**
   - Levene's test indicates heterogeneity of variance (p-value: <0.05).
   - Kruskal results suggest a statistically significant difference in mean invoice across RFM segments (p-value: 0.0).
6. **Location Kruskal-Wallis Test:**
   - Levene's test indicates homogeneity of variance (p-value: 0.31).
   - Kruskal-Wallis results suggest no statistically significant difference in mean invoice across locations (p-value: 0.11).
7. **Coupon_Code Kruskal-Wallis Test:**
   - Levene's test indicates heterogeneity of variance (p-value: 0.0).
   - Kruskal-Wallis results suggest statistically significant difference in mean invoice across coupon codes. (p-value: 1.92e-173).

These results provide insights into the differences in mean invoice across different groups, as well as the normality and variance assumptions of the tests performed.

8.0.5 Gender Invoice Insights:

- Female customers have a higher total invoice amount ($1,193,025) compared to male customers ($738,967.50).

8.0.6 Churn Invoice Insights:

- Customers who did not churn have a significantly higher total invoice amount ($1,837,792) compared to churned customers ($94,201.23).

8.0.7 Tenurebin Invoice Insights:

- Customers in the 20-30 tenure months category have the highest total invoice amount ($472,881.24), followed by customers in the 30-40 tenure months category ($454,830.86).

8.0.8 RFM Segment Invoice Insights:

- Potential Loyalists, identified as a valuable segment, have the highest total invoice amount ($666,863.19), while the Lost segment has the lowest total invoice amount ($1,905.32).

8.0.9 Location Invoice Insights:

- Transactions from Chicago contribute the highest total invoice amount ($679,791.56), followed by California ($584,489.26),and New York ($400,631.41).

8.0.10 Coupon_Code Insights:

- ELEC 10,20,30 and SALE 10,20,30 contributes the most to total `Invoice`.

9 Churn Analysis

9.1 Q. Is there significant relationship between categorical columns and churn?

9.1.1 Applying chisquare test of independence with significance value alpha set to .05.

H0 : The categorical column and churn is not dependent on each other.

H1 : There is significant dependence of churn on the categorical column.

Significance level(alpha) is set to .05

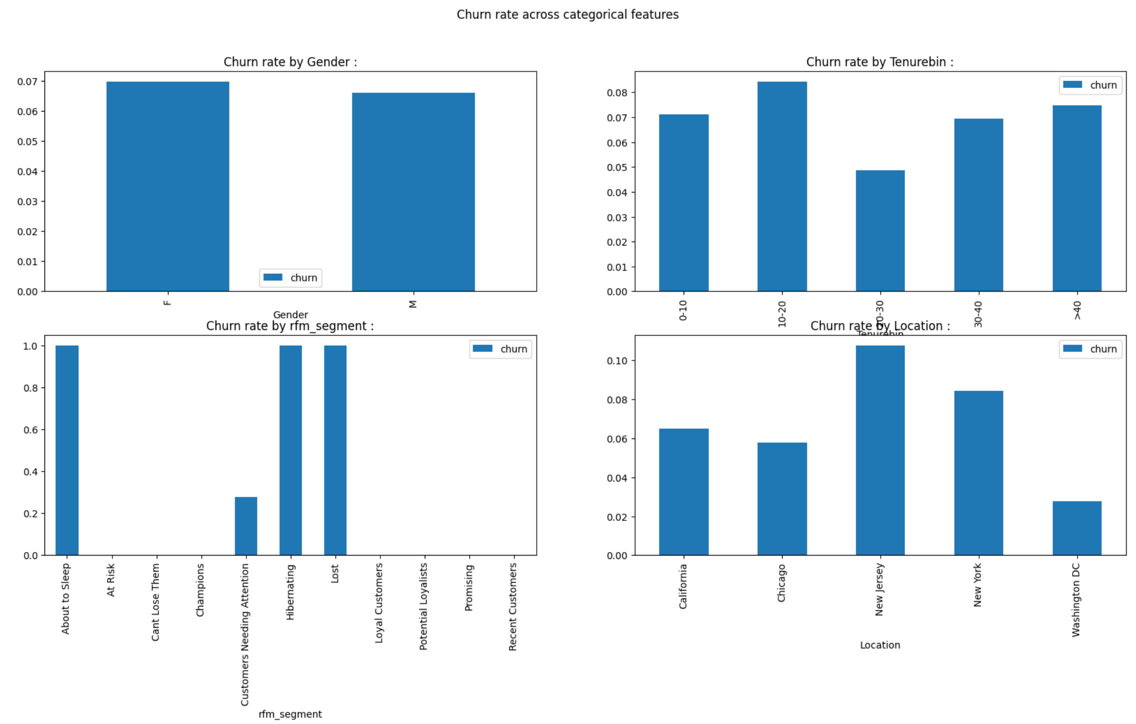
[67]:
```
categorical=['Gender', 'Tenurebin', 'rfm_segment','Location' ]
for col in categorical:
    ct=pd.crosstab(df[col],df['churn'])
    pval=chi2_contingency(ct).pvalue
    if pval<=.05:
        print(f'As pvalue({pval})<=alpha(.05) we  reject null hypothesis, churn␣
 ↪is significantly dependent on {col}')
    else:
        print(f'As pvalue({pval})>alpha(.05) we fail to reject null hypothesis,␣
 ↪churn is NOT significantly dependent on {col}')
```

```
As pvalue(0.11502249180753568)>alpha(.05) we fail to reject null hypothesis,
churn is NOT significantly dependent on Gender
As pvalue(4.341700473181041e-25)<=alpha(.05) we  reject null hypothesis, churn
is significantly dependent on Tenurebin
As pvalue(0.0)<=alpha(.05) we  reject null hypothesis, churn is significantly
dependent on rfm_segment
As pvalue(8.669623094961317e-55)<=alpha(.05) we  reject null hypothesis, churn
is significantly dependent on Location
```

[68]:
```
fig,axes=plt.subplots(2,2,figsize=(20,9))
ax=axes.flatten()
Store=[]
```

```
plt.suptitle('Churn rate across categorical features')
for i,col in enumerate(categorical):
    group=df.groupby(col,as_index=False)['churn'].mean()
    Store.append(group)
    ax[i].set_title(f'Churn rate by {col} :')
    group.plot(kind='bar',x=col,y='churn',ax=ax[i])

plt.show()
```



[69]:
```
for i in Store:
    print(i)
    print()
```

```
  Gender     churn
0      F  0.069682
1      M  0.066074

  Tenurebin     churn
0      0-10  0.071057
1     10-20  0.084206
2     20-30  0.048697
3     30-40  0.069528
4       >40  0.074701
```

```
                 rfm_segment     churn
0              About to Sleep  1.000000
1                     At Risk  0.000000
2              Cant Lose Them  0.000000
3                   Champions  0.000000
4   Customers Needing Attention  0.279327
5                 Hibernating  1.000000
6                        Lost  1.000000
7             Loyal Customers  0.000000
8          Potential Loyalists  0.000000
9                   Promising  0.000000
10            Recent Customers  0.000000
```

```
        Location     churn
0     California  0.065072
1        Chicago  0.057835
2     New Jersey  0.107484
3       New York  0.084400
4  Washington DC  0.027818
```

9.1.2 Churn Dependence Insights:

1. **Gender:**
    - Churn is NOT significantly dependent on gender (p-value: 0.115).
2. **Tenurebin:**
    - Churn is significantly dependent on tenurebin (p-value: 4.34e-25).
    - Customers with tenure between 20-30 months have the lowest churn rate (4.87%), while those with tenure between 10-20 months have the highest churn rate (8.42%).
3. **RFM Segment:**
    - Churn is significantly dependent on RFM segment (p-value: 0.0).
    - Customers categorized as 'At Risk', 'Cant Lose Them', 'Champions', 'Loyal Customers', and 'Potential Loyalists' have the lowest churn rates (0.0%), indicating high loyalty.
4. **Location:**
    - Churn is significantly dependent on location (p-value: 8.67e-55).
    - Customers from Washington DC exhibit the lowest churn rate (2.78%), while those from New Jersey have the highest churn rate (10.75%).

These insights highlight the factors influencing churn rates, including tenure, RFM segment, and location. Understanding these dependencies can help in devising targeted retention strategies and improving customer loyalty.

9.1.3 Crosschecking by checking if mean `Invoice` and mean `Tenure` is signficantly different for churn and not churn.

H0 : Not churned customers have mean invoice less than or equal to that of churned customer.

H1 : Not churned customers have mean invoice greater than that of churned customer.

Significance level(alpha)=.05

[70]:
```
C,Nc=df[df['churn']==1]['Invoice'],df[df['churn']==0]['Invoice']
levene(Nc,C)
```

[70]:
```
LeveneResult(statistic=42.93837475167171, pvalue=5.70083792022353e-11)
```

As Levene test pvalue<.05 equal_var is set to False

[71]:
```
ttest_ind(Nc,C,alternative='greater',equal_var=False)
```

[71]:
```
TtestResult(statistic=10.502516703639804, pvalue=7.411181740803589e-26,
df=5391.8653543032015)
```

9.1.4 As pvalue< .05 we reject null hypothesis and can conclude that not churned customers have higher mean `Invoice` value which is expected by definition.

H0 : Not churned customers have mean tenure greater than or equal to that of churned customer.

H1 : Not churned customers have mean tenure less than that of churned customer.

Significance level(alpha) is set to .05.

[72]:
```
C,Nc=df[df['churn']==1]['Tenure_Months'],df[df['churn']==0]['Tenure_Months']
levene(Nc,C)
```

[72]:
```
LeveneResult(statistic=58.40757862523135, pvalue=2.166461537104734e-14)
```

As Levene test pvalue<.05 equal_var is set to False

[73]:
```
ttest_ind(Nc,C,alternative='less',equal_var=False)
```

[73]:
```
TtestResult(statistic=0.2037658181614431, pvalue=0.580726699025027,
df=4106.604928531195)
```

9.1.5 As pvalue> .05 we fail to reject null hypothesis and cannot conclude that not churned customers have lower mean `Tenure_Months` value.

- **`Invoice` Value Analysis:**
  - The statistical test indicates that non-churned customers have a significantly higher mean invoice value compared to churned customers ($p < 0.05$). This aligns with expectations, as loyal customers tend to make more larger purchases over time.
- **`Tenure_Months` Analysis:**
  - The analysis reveals that non-churned customers do not have lower mean tenure value.

10 Customer Lifetime Value (CLTV)

10.0.1 Feature Engineering

[74]:
```
df.Coupon=df.Discount_pct*df.Coupon
encoder = TargetEncoder()
df['Location_enc'] = encoder.fit_transform(df['Location'], df['Invoice'])

customer_df = df.groupby('CustomerID').agg({
    'Invoice': 'sum',
    'Transaction_ID': 'nunique',
    'Location_enc':'mean',
    'Quantity':'median',
    'Tenure_Months': 'median',
    'Coupon': 'mean',
    'churn': 'mean',
}).reset_index().rename(columns={'Transaction_ID':'Total_Transactions'})
```

10.0.2 Splitting and Tuning and Stacking

[75]:
```
X = customer_df[['Total_Transactions', 'Quantity', 'Tenure_Months', 'Coupon',␣
↪'churn','Location_enc']]
y = customer_df['Invoice']

X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2,␣
↪random_state=95)

param_grid = {
    'fit_intercept': [True, False]
}

model = LinearRegression()
grid_search = GridSearchCV(estimator=model, param_grid=param_grid, cv=3,␣

```

10.1 Through stacking and hyperparameter tuning a regression model is built with decent .84 r^2 value and 756 RMSE which predicts total revenue that a customer generates based on the features Location, count of transactions, median Quantity bought, Tenure, median Coupon discount availed and churn.

11 Recommendations Based on Insights

1. **Targeted Marketing for Top Products:** Focus marketing campaigns on top-performing products such as the Nest Learning Thermostat 3rd Gen-USA and Nest Cam Outdoor Security Camera. Highlight their features and benefits to capitalize on their high demand.

2. **Leverage Peak Sales Months:** Increase promotional activities and special offers during January, November, and August, as these months show the highest total invoice amounts. Utilize events like New Year sales, Black Friday, and back-to-school promotions to maximize revenue.
3. **Optimize Coupon Strategies:** Promote and potentially expand successful coupon codes like ELEC10, ELEC20, and ELEC30. These codes drive significant sales volume and should be a focal point in discount strategies.
4. **Enhance Customer Retention Programs:** Develop loyalty programs targeting customers with tenure between 20-30 months, who exhibit the lowest churn rates. Personalized offers and engagement strategies can help maintain their loyalty and reduce churn.
5. **Address High Churn Regions:** Implement targeted retention strategies for regions with high churn rates, particularly New Jersey. Tailor marketing efforts and customer service improvements to address specific needs and reduce churn in these areas.
6. **Promote Product Bundles:** Highlight product combinations that show significant associations, such as the Nest Cam Indoor and Outdoor Security Cameras. Cross-sell these products to customers to increase average transaction values.
7. **Improve Customer Experience for High-Value Segments:** Focus on enhancing the customer experience for high-value RFM segments like Loyal Customers and Potential Loyalists. Provide exclusive benefits and personalized services to keep them engaged and loyal.
8. **Expand Successful Product Categories:** Increase the variety and visibility of high-demand categories such as Nest-USA, Apparel and Office supplies. Tailor marketing campaigns to showcase the range and quality of products in these categories.
9. **Monitor Seasonal Spending Patterns:** Develop strategies and discounts to boost sales during typically lower profit periods such as from Q1-Q2 and Q3-Q4. Also utilize high profit during Q2-Q3 by further increasing sales volume through discounts and other strategies.
10. **Leverage High-Retention Cohorts:** Focus retention efforts on high-performing cohorts like '2019-01' and '2019-02'. Analyze what contributed to their higher retention rates and replicate successful strategies across other cohorts.
11. **Utilize CLTV predictions:** Use the predictive model's CLTV estimates to prioritize retention efforts, personalize marketing strategies, and optimize resource allocation for maximum long-term profitability.
